k c nicolaou winner of the nemitsas prize 2014 in chemistry adopting his didactically skillful approach k c nicolaou compiles in this textbook the important synthetic methods that lead to a complex molecule with valuable properties he explains all the key steps of the synthetic pathway highlighting the major developments in blue boxed sections and contrasting these to other synthetic methods a wonderful tool for learning and teaching and a must have for all future and present organic and biochemists

fourth volume of a classic in the field of organic synthesis describing retrosynthetic analysis and total synthesis of important molecules classics in total synthesis iv is a compilation of highly important synthetic methods which lead to complex molecules with valuable properties from the complex architectures of natural products to the streamlined synthesis of functional molecules each chapter in classics in total synthesis iv unfolds a unique story the interplay of mechanisms reactivity selectivity and stereochemical aspects is thoroughly examined echoing the pedagogical format that has become synonymous with this series well designed graphics are included throughout and all important parts of the reaction sequences are highlighted this volume encapsulates the culmination of new methodologies emerging trends and a selection of significant total syntheses undertaken from 2009 to 2022 while additionally including two earlier syntheses from 1979 and 1992 for comparison and to highlight the development of organic synthesis over the past decades the careful balance between historical context comments on the molecules impact to humankind and the design and execution aspects of each synthesis creates a narrative that is not only clear but also intellectually stimulating written by k c nicolaou ruocheng yu and stephan rigol classics in total synthesis iv includes 16 chapters covering coupling and rearrangement reactions recent advances in nonenzymatic enantioselective cyclization cycloaddition and annulation reactions c h functionalization and transition metal mediated c h activation electroorganic chemistry and visible light photoredox catalysis hat initiated olefin hydrogenation isomerization and hydrofunctionalization joining its predecessors in weaving together the threads of scientific discovery challenge and intellectual pursuit and establishing strong connections with biology and medicine classics in total synthesis iv is an essential reference for all future and present synthetic organic chemists

this series stemmed from a group of weekly seminars in our research group aimed at keeping its members abreast of recent developments in organic synthesis the seminars tended to consist of several syntheses of natural products or related systems with particular emphasis on the general strategy inherent in the effort new and interesting reactions which were utilized in the work and specificity or the lack of it in arranging the relative stereochemistry of asymmetric centers and the geometry of double bonds we found that natural products offered an attractive setting in which the larger science of organic chemistry could be put to crucial tests a truly elegant synthesis is a major advance in that it epitomizes how an imaginative mastery of the course of organic reactions can achieve a sophisticated objective by an economy of operations indeed any successful synthesis of a reasonably complex product however cumbersome and graceless is an important event for those who delight in the problem solving dimension of science

and clarity k c nicolaou and e sorensen present the most remarkable and ingenious total syntheses from outstanding synthetic organic chemists to make the complex strategies more accessible especially to the novice each total synthesis is analyzed retrosynthetically the authors then carefully explain each synthetic step and give hints on alternative methods and potential pitfalls numerous references to useful reviews and the original literature make this book an indispensable source of further information special emphasis is placed on the skillful use of graphics and schemes retrosynthetic analyses reaction sequences and stereochemically crucial steps are presented in boxed sections within the text for easy reference key intermediates are also shown in the margins graduate students and researchers alike will find this book a gold mine of useful information essential for their daily work every synthetic organic chemist will want to have a copy on his or her desk

success comes in many forms and in synthesis it can be a failure that results in their ultimate successful solutions this long awaited sequel to dead ends and detours retains the proven concept while featuring over 20 new case studies of failed strategies and their successful solutions in natural product total synthesis additionally computational models are used to discuss the problem in much more detail and to provide readers with additional information not found in the primary literature the topics range from classic synthetic reactions e g diels alder reaction metal mediated coupling reactions metathesis and asymmetric catalysis to the importance of protecting and activating groups this book will benefit not only graduate students in organic chemistry but also advanced researchers as they gain knowledge derived from the step by step analysis of mistakes made in the past and thus be able to improve their own chemical reaction planning with its coverage of the most commonly applied reaction types the book perfectly complements its predecessor which focuses on general aspects such as reactivity and selectivity

a plethora of publications provide valuable information for the organic chemist yet the results are almost always based on successful reactions however a chemist s life is unfortunately not that easy on the contrary trial and error is still one of the most commonly used methods thus it would be useful to have access to those syntheses that do not work since they also provide important results of great importance for further synthesis this long awaited book by m a sierra and m c de la torre fills just such a gap using major total syntheses they explain the most varied problems and recommend ways out of such dilemmas problems at the start and end of a synthesis difficult and unexpected reactivities of functional groups problems due to steric properties and much more the result is a true wealth of information for any organic chemist the essential tool for successful total synthesis
